# Operators...

An operator is a symbol that tells the computer to perform certain mathematical or logical manipulation

## Arithmetic operator:

There are five(5) arithmetic operators in C

Operator	Name	Example
+	Addition	$a + b$
-	Subtraction	$a - b$
*	Multiplication	$a * b$
/	Division	$a / b$
%	Remainder	$a \% b$

## Arithmetic operators (Contd...)

- The data items that operators act upon are called ***operands***
- The operands can be integer quantities, floating-point quantities or characters

The remainder operator (%) requires that both operands be integers and the second operand be nonzero. Similarly, the division operator (/) requires that the second operand be nonzero.

Division of one integer quantity by another ***always*** results in a truncated value (i.e., the decimal portion of the value will be dropped).

If a division operation is carried out with two floating-point numbers, or with one floating-point number and one integer, the result will be a floating-point

# Arithmetic operators (Contd...)

Example:

If a and b are integers  
a=10 ; b=3

Expression	Value
a + b	13
a - b	7
a * b	30
a /b	3
a % b	1

# Performance Test 1

➤ Write a C program that will divide 29765 apples to 51 buyers. Display how many apples each buyer will get and how many apples will be left (Use of arithmetic operator is a must, do not do the calculations and then print the desired output).

Time: 3 minutes!!

# ANSWER

```
#include <stdio.h>
```

```
void main()
```

```
{
```

```
    int a,b,c,d;
```

```
    a=29765;
```

```
    b=51;
```

```
    c=29765/51;
```

```
    d=29765%51;
```

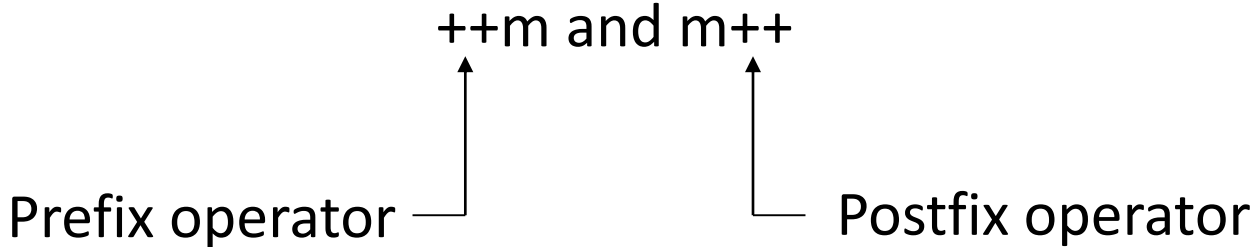

```
    printf("%d and %d",c,d);
```

```
}
```

```
583 and 32  
Process returned 0 (0x0)   execution time : 0.015 s  
Press any key to continue.
```

# Increment/decrement operator

- $++a/a++$  is equivalent to  $a=a+1$
- $--a/a--$  is equivalent to  $a=a-1$

The difference for built-in types is:

- $++a$  first increments the value of  $a$  and then returns a value referring to  $a$ , so if the value of  $a$  is used then it will be the incremented value.
- $a++$  first returns a value whose value is  $a$ , that is, the old value, and then increments  $a$  at an unspecified time before the next full-expression (i.e., "before the semicolon").

## Increment/decrement operators(Contd...)

- ❖  $x=x^*a++$  is equivalent to  $x=x^*a$  ;  $a=a+1$
- ❖  $x=x^*++a$  is equivalent to  $a=a+1$  ;  $x=x^*a$
  
- ❖  $y=y^*b--$  is equivalent to  $y=y^*b$  ;  $b=b-1$
- ❖  $y=y^*--b$  is equivalent to  $b=b-1$  ;  $y=y^*b$

## Increment/decrement Operators(Contd...)

- Write the following program:

```
#include<stdio.h>

void main()
{
int a=10,b=20,x;
x=a*++b;
printf("\n The value of x is: %d",x);
}
```

For  $x=a*++b$  output:

210

& for  $x=a*b++$  output:

200

**Replace the line  $x=a*++b$  with  $x=a*b++$**

# Assignment Operator

Operator	Description	Example
<code>+=</code>	Add AND assignment operator	<code>C += A</code> is equivalent to <code>C = C + A</code>
<code>-=</code>	Subtract AND assignment operator	<code>C -= A</code> is equivalent to <code>C = C - A</code>
<code>*=</code>	Multiply AND assignment operator	<code>C *= A</code> is equivalent to <code>C = C * A</code>
<code>/=</code>	Divide AND assignment operator	<code>C /= A</code> is equivalent to <code>C = C / A</code>

# Relational Operators (Contd..)

Also called Comparison operators

It performs tests on their operands. They return the Boolean value. Such as:

- 1 if the statement is successful (true)
- 0 otherwise

Example	Name	Result
$a == b$	Equal	<b>TRUE</b> if a is equal to b.
$a != b$	Not Equal	<b>TRUE</b> if a is not equal to b.
$a < b$	less than	<b>TRUE</b> if a is strictly less than b.
$a > b$	greater than	<b>TRUE</b> if a is strictly greater than b.
$a <= b$	less than or equal to	<b>TRUE</b> if a is less than or equal to b.
$a >= b$	greater than or equal to	<b>TRUE</b> if a is greater than or equal to b.

# LOGICAL Operators

Example	Name	Result
<code>! a</code>	Not	<b>TRUE</b> if <b>a</b> is not <b>TRUE</b> .
<code>a &amp;&amp; b</code>	And	<b>TRUE</b> if both <b>a</b> and <b>b</b> are <b>TRUE</b> .
<code>a    b</code>	Or	<b>TRUE</b> if either <b>a</b> or <b>b</b> is <b>TRUE</b> .

<b>a</b>	<b>b</b>	<b>a &amp;&amp; b</b>	<b>a    b</b>
0	0	0	0
0	1	0	1
1	0	0	1
1	1	1	1

# The ? : operator

## General form:

Conditional expression? Expression1 : Expression2

## Example:

```
if (x<0)
    flag = 0;
else
    flag = 1;
```

The above statement can be written as

```
flag = (x<0) ? 0 : 1;
```

# Math.h (header file)

- Most of the mathematical functions are placed in math.h header
- Some are specified in the stdlib.h header
- Some common mathematical functions:

Function Name	Description
exp(x)	returns $e$ raised to the given power ( $e^x$ )
sqrt(x)	computes square root ( $\sqrt{x}$ )
cos(x)	computes cosine ( $\cos(x)$ )
pow(x,y)	raises a number to the given power ( $x^y$ ) [pow(x,y)]
sinh(x)	computes hyperbolic sine ( $\sinh(x)$ )
erf(x)	error function
And so on.....	tan(x), abs(x), log10(x)....etc

- The outputs of the functions are of the **double format**.

# *Math.h* header file

## ➤ Math Constants:

Constant Name	Description
M_E	The base of natural logarithms (e).
M_LOG2E	The base-2 logarithm of e.
M_PI	3.141593
M_SQRT2	The positive square root of 2.
M_SQRT1_2	The positive square root of 1/2.
And so on.....	

# Practice Example

```
#include<stdio.h>
#include<math.h>
int main()
{
double pi;
pi=M_PI; //sets pi = 3.1416
double sum;
sum=cos(pi);
//here in cos(x) , x is radian value, so input should be radian
printf(“%lf”,sum);
return 0;
}
```

output:  
-1.000000

## # Class Performance 2

- Write a program that takes two numbers as input.
  - Find the square root of the first number and the resulting output will be the radius of a cylinder.
  - Raise the second input number to a power of 5. The resulting output will be the height of the cylinder.
  - Find the volume of the cylinder by using the saved value of pi in the header file.
- 
- **Remember to use the math.h file.**

# ANSWER

```
#include <stdio.h>
#include <stdlib.h>
#include <math.h>
int main()
{   int a,b;
    double r,h,pi,V;
    pi= M_PI;
    printf("Enter the first number: \n");    scanf("%d",&a);
    printf("Enter the second number: \n");  scanf("%d",&b);
    r= sqrt(a);
    h= pow(b,5);
    V=pi*r*r*h;
    printf("The volume is %lf",V);
    return 0; }
```

```
Enter the first number:
2
Enter the second number:
10
The volume is 628318.530718
Process returned 0 (0x0)   execution time : 4.996 s
Press any key to continue.
```

## The getch() function

The **getch( )** function reads a single **character** the instant it's typed without waiting for ENTER.

**get** means it gets something i.e. it's an input function  
**ch** means it gets a character

## The getche() function

The **getche( )** function also reads a single **character** the instant it's typed without waiting for ENTER **and also echoes it.**

**get** means it gets something i.e. it's an input function  
**ch** means it gets a character  
**e** means it echoes the character to the screen when you type it.

# Example

```
#include <stdio.h>
```

```
void main(void)
```

```
{
```

```
    char test;
```

```
    printf("Type any character: ");
```

```
    test = getch();
```

```
    printf("\nThe character you typed was:  
    %c", test);
```

```
}
```

```
Type any character:  
The character you typed was: s  
Process returned 0 (0x0)   execution time : 0.728 s  
Press any key to continue.
```

**Replace getch() with getche()**

# Conditional Statements

# The *if* statement

## General form:

```
if (condition)
{
    statement;
}
```

## Conditions:

1. Using relational or conditional operators
2. Using logical operators

## Multiple statements within if

### General form:

```
if (condition)
{
    statement 1;
    statement 2;
    -----;
    statement n;
}
```

## Example of *if* statement

Write the following program with multiple statements

```
int i;  
printf("Enter an Integer: ");  
scanf("%d",&i);  
if (i==1)  
{  
    printf("\n You typed 1");  
    printf("\n End of statement");  
}  
printf("\n End of the program");
```

If you type 1, Output:

Enter an Integer: 1

You typed 1

End of Statement

End of the program

If you type any other no.,  
except 1 .Output:

Enter an Integer: 3

End of the program

## General form

### *if-else*

```
if (condition)
{
    statement 1;
    statement 2;
}

else
{
    statement 1;
    statement 2;
}
```

**Note: else is optional**

### *if-else if-else*

```
if (condition)
{
    statement 1;
    statement 2;
}

else if (condition)
{
    statement 1;
    statement 2;
}

else
{
    statement 1;
    statement 2;
}
```

## Example of if-else statement

Write the following program with multiple statements

```
int i;
printf("Enter an Integer: ");
scanf("%d", &i);
if (i==1)
{
    printf("\n You typed 1");
}
else
{
    printf("\n You did not type 1");
}
printf("\n End of the program");
```

## Example of if- else if- else statement

```
int num;
printf("Enter an Integer: ");
scanf("%d",&num);
if (num < 0)
{
    printf("\n the number is less than zero");
}
else if(num == 0)
{
    printf("\n the number is equal to zero");
}
else
{
    printf("\n the number is greater than zero");
}
```

```
Enter an Integer: 12
```

```
the number is greater than zero
Process returned 33 (0x21)   execution time : 2.503 s
Press any key to continue.
```

# Nested *if-else* statements

## General form

```
if (condition)
{
    statement;
}

else
{
    if (condition)
    {
        statement;
    }

    else
    {
        statement;
    }
}
```

## Another form

```
if (condition)
{
    if (condition)
    {
        statement;
    }
    else
    {
        statement;
    }
}

else
{
    statement;
}
```

## # Class Performance 3

**Write a C program to prepare an electricity bill.**

<u>No. of Units consumed</u>	<u>Amount of bill</u>
Less than or equal to 100	200
Between 101 and 130	250
Between 131 and 150	275
Over 150	300

**Take the number of units consumed as input and print the amount of total bill as output.**

# ANSWER

```
void main()
{
    int x;
    printf("Enter the amount of bill: ");
    scanf("%d",&x);
    if (x<=100)
    {
        printf("The amount of bill is 200"); }
    else if(x>101 && x<130)
    {
        printf("The amount of bill is 250"); }
    else if(x>131 && x<150)
    {
        printf("The amount of bill is 275"); }
    else
    {
        printf("The amount of bill is 300"); }
}
```

## Assignments:

- 1. Write a C program to find the smallest of 3 integers taken as input using nested if-else statement .**
- 2. Write a C program to find the roots of a Quadratic Equation  $ax^2+bx+c = 0$ , that will take coefficients a, b, c as input and find the roots as output.. Use nested if-else statement.**

# Thank you

Everything has its beginning. But it doesn't start at "one."

-Metal Gear Solid 4
